Introduction

Temporal patterns and popularity prediction

Modeling conversation threads

Outline

Introduction

Temporal patterns and popularity prediction

Modeling conversation threads

Motivation

Dynamics of online conversations

- ▶ Temporal dimension
 - ▶ What temporal patterns govern these social phenomena?
 - ▶ Can we predict popularity of news?
- ▶ Structural dimension
 - ▶ Can we model how conversation trees evolve in time?
 - ▶ Can we characterise user behaviour in terms of this model?

Motivation

General methodology

- ▶ Parsimonious data-driven approach
 - ▶ Few parameters that are interpretable
 - ▶ Simple optimisation problems
- ▶ Role of the content
 - ▶ Explain as much as possible without considering content
- ▶ Analysis at the population level
 - ▶ Single-user data is too noisy
 - ▶ Aggregate analysis averages out the noise

Motivation

Example of conversation in Slashdot (post):

Screenshot of a Mozilla Firefox browser window showing aSlashdot post titled "Polynomial Time Code For 3-SAT Released, P==NP".

The post was made at 04:47am on Thursday January 20, 2011 by vgomez.

An anonymous reader writes:

"András Ásványos has released what he claims is a polynomial-time algorithm for solving 3-SAT. Because 3-SAT is NP-complete, this would imply that P==NP. While there's still good reason to be skeptical that this is, in fact, true, he's made source code available and appears decidedly more serious than most of the people advertising to prove that P=NP or P!=NP. Even though it's probably wrong, just based on the sheer number of prior failures, it seems more likely to lead to new discoveries than meat. Note that there are already algorithms to solve 3-SAT, including one that runs in time $(4/3)^n$ and succeeds with high probability. Incidentally, this wouldn't necessarily imply that encryption is worthless; it may still be too slow to be practical."

| Even though this is probably wrong, just based on the sheer number of prior failures ...

Okay, so I'm going to agree with you that it's probably wrong. After reading the paper once last night in a sort of sleep state, it's certainly a novel way of massaging each 3-Sat problem into an expanded space of memory (compact triplets structures) and then reducing this to solve the problem (all within polynomial time).

Okay, so I'm going to agree with you that it's probably wrong. After reading the paper once last night in a sort of sleepy state, it's certainly a novel way of massaging each 3-Sat problem into an expanded space of memory (compact triplets structures) and then reducing this to solve the problem (all within polynomial time).

So the great thing about this paper is that it's short. It's not theoretical (which is a double-edged sword) has been implemented (in Java, no less) and it's incredibly fallacious. I'm not intelligent enough to poke holes in his proofs for this but people can apply the code to CNF/C (formulae) problems to their heart's content and if they find one that produces the wrong answer then this is falsified.

I hope we find someone capable of commenting on the post involving the transformation of the problem from compact triplets formula to compact triplets structure and the hyperstructures presented in the paper. If this is legit, the 3-Sat problem is one that more complex problems are reduced to in order to show that solid complex problems are NP-complete. And that's something that's been proved by the Cook-Levin theorem [wikipedia.org] and given in the classic Computers and Intractability: A Guide to the Theory of NP-Completeness by Garey and Johnson.

Refreshing tangible implementation, if I may say so myself.

Replies to this:

- Re: Maybe I'm overlooking something, but to me it looks like they're doing the reduction to a polynomial-time problem already at the very beginning of the paper (I guess if there is a fault, there it hides). As soon as they go to
- Re: This is not a P=NP paper. The paper solves a problem of a related data structure in polynomial time (quartic time), then shows that it can be used to solve some cases of 3SAT. The 3 outputs the algorithm can give are "The

encryption (Score 5, Informative) by davej (77736) on Thursday January 20, 2011 at 11:59AM (PST) [message inverse]

Incidentally, this wouldn't necessarily imply that encryption is worthless. It may still be too slow to be practical.

No, it means good encryption will be much less practical. Computers will always get faster so "too slow" is not a good argument. If P != NP you can always make encryption too hard to break by increasing the key size - the cost to

Example of conversation in Wikipedia:

The screenshot shows a Mozilla Firefox browser window with the address bar set to <http://en.wikipedia.org/wiki/Talk:Germany>. The main content area displays a discussion on the talk page for the article "World War II". The discussion is centered around the inclusion of World War II in the introduction of the article. Several users have contributed comments, including [KarMathiesen](#), [RicBep](#), [Alarics](#), [Atwardow](#), and [Matthew.toffeimire](#). The comments range from requests to correct mistakes to discussions about the scope and depth of the introduction. The interface includes standard Firefox navigation buttons and a toolbar at the top.

Please correct the 2 instances of the mistake, no such word as "triaide" in English. Thank you. [RicBep](#) (talk) 20:03, 1 January 2011 (UTC)

Done. [KarMathiesen](#) (talk) 23:39, 6 January 2011 (UTC)

World War II [edit]

I would like to reopen a discussion on the inclusion of World War II into the first paragraph. Considering:

- The immense scale and violence of the conflict, its unprecedented global character and its wide-reaching effects,
- The war's indelible and ongoing mark on international affairs 70 years later, its shifting of the global balance of power, its transformation of Europe's political and social character,
- The war's precipitation of history's (arguably) most egregious organized genocide, and
- Germany's undeniable role in starting and leading the conflict.

It would probably be a good idea to include a half-sentence mention in the introduction of Germany's role in World War II. It's impossible to look at international affairs, the dynamics of European life today, or the power of the United States (just to name a few examples) without thinking about World War II. Germany is known for many great historical achievements, but this is one dark area of its existence that can't simply be ignored in a brief summary of its history. [Atwardow](#) (talk) 04:53, 17 January 2011 (UTC)

I completely agree. I tried to make this point a few months ago but was shouted down. -- [Alarics](#) (talk) 11:14, 17 January 2011 (UTC)

I suppose that unless someone vociferously objects, I will go ahead and make the addition. [Atwardow](#) (talk) 06:33, 18 January 2011 (UTC)

I personally don't want to see Germany known as the country that killed millions of people, but I suppose if it's widely agreed to have this point included, I could live with it. However, if at all possible, I would like it to show that it was not Germany in general, but Adolf Hitler. [Matthew.toffeimire](#) (talk) 18:39, 18 January 2011 (UTC)

As now worded by [Atwardow](#), it says "the Third Reich under Adolf Hitler" so your point is surely met. -- [Alarics](#) (talk) 19:10, 18 January 2011 (UTC)

I certainly respect your concern, [Matthew.toffeimire](#). That is why I hope that by mentioning Adolf Hitler, my edit will not be a universal indictment of the German nation. That itself is an issue of debate, however. Hitler did not act alone, but rather with the enthusiastic cooperation of millions. Adding a mention of WWII is merely acknowledging the German responsibility for the war. [Atwardow](#) (talk) 19:37, 18 January 2011 (UTC)

In general: The introduction has to reflect the article content as a whole. Right now the Culture of Germany for instance is not mentioned although it covers a large part in the article itself. Instead the History of Germany covers around 1/3 of the entire introduction. This seems already very long compared to the size of the History in the total article.

Please keep in mind that the History of German states, as it is presented so far, covers 2000 years. Please also keep in mind that no individuals of any period can be mentioned in the introduction in general, because the History of the STATE remains the significant focus.

The wording of the introduction needs therefore an amendment to ensure a non-personalized proportionate narrative. [KarMathiesen](#) (talk) 21:54, 18 January 2011 (UTC)

Wind farm figures no longer correct [edit]

The caption with the wind farm reads:

"[The largest wind farm and solar power capacity in the world is installed in Germany](#)"

Introduction

Temporal patterns and popularity prediction

Modeling conversation threads

Motivation

Scientific questions

Temporal patterns in news aggregators

[Kaltenbrunner et al, 2007]

- ▶ What are the temporal patterns governing these responses?
- ▶ Is there a mathematical law that describes this patterns?
- ▶ Can we use this law to predict number of votes (popularity) in the long term?

Structure and evolution of conversation threads

[Gómez et al, 2013]

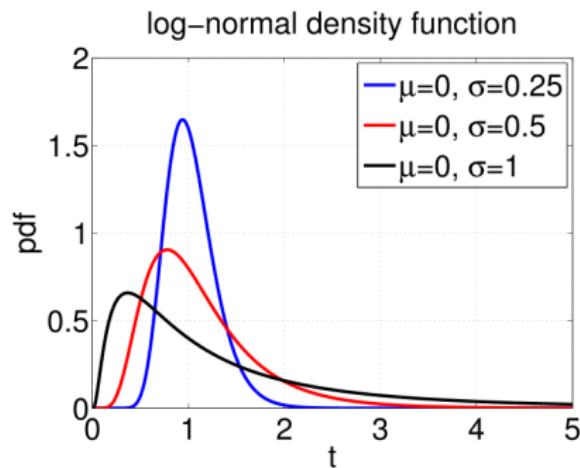

- ▶ What are the structural patterns governing these responses?
- ▶ Is there a generative model that captures their statistical properties?
- ▶ Can we use the model parameters to characterize websites, user behaviour, conversations?

Preliminaries

The Log-Normal distribution

- Continuous probability distribution of a random variable whose logarithm is normally distributed

$$f_{LN}(t; \mu, \sigma) = \frac{1}{t\sigma\sqrt{2\pi}} \exp\left(\frac{-(\ln(t) - \mu)^2}{2\sigma^2}\right)$$

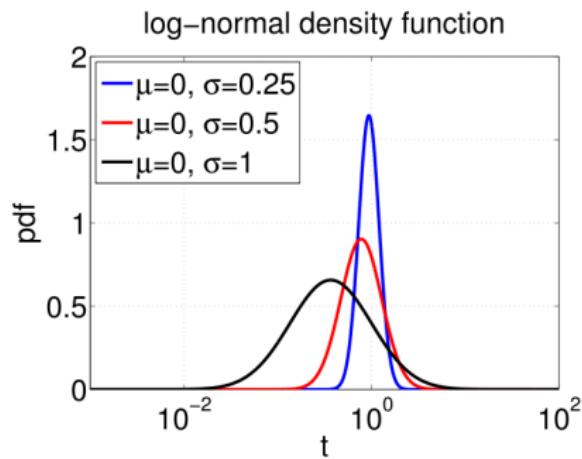

Preliminaries

The Log-Normal distribution

- ▶ Continuous probability distribution of a random variable whose logarithm is normally distributed

$$f_{LN}(t; \mu, \sigma) = \frac{1}{t\sigma\sqrt{2\pi}} \exp\left(\frac{-(\ln(t) - \mu)^2}{2\sigma^2}\right)$$

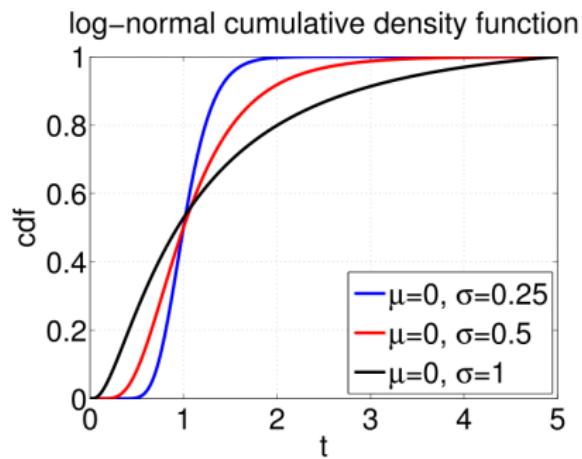

Preliminaries

The Log-Normal distribution

- ▶ Continuous probability distribution of a random variable whose logarithm is normally distributed

$$f_{LN}(t; \mu, \sigma) = \frac{1}{t\sigma\sqrt{2\pi}} \exp\left(\frac{-(\ln(t) - \mu)^2}{2\sigma^2}\right)$$

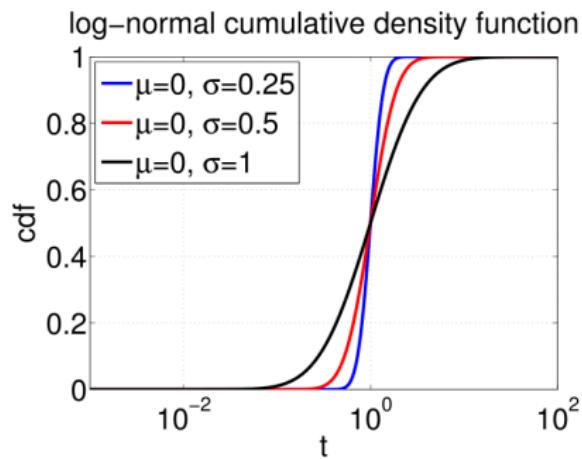

Motivation

The Log-Normal distribution

- ▶ Continuous probability distribution of a random variable whose logarithm is normally distributed

$$f_{LN}(t; \mu, \sigma) = \frac{1}{t\sigma\sqrt{2\pi}} \exp\left(\frac{-(\ln(t) - \mu)^2}{2\sigma^2}\right)$$

Preliminaries

Fitting log-normal distributions

- ▶ A dataset of points is given $\mathbf{t} = t_1, \dots, t_n$
- ▶ Maximum likelihood

$$\mathcal{L}(\mathbf{t}; \mu, \sigma) = \prod_{i=1}^n \left(\frac{1}{t_i} \right) \mathcal{N}(\ln t_i; \mu, \sigma)$$

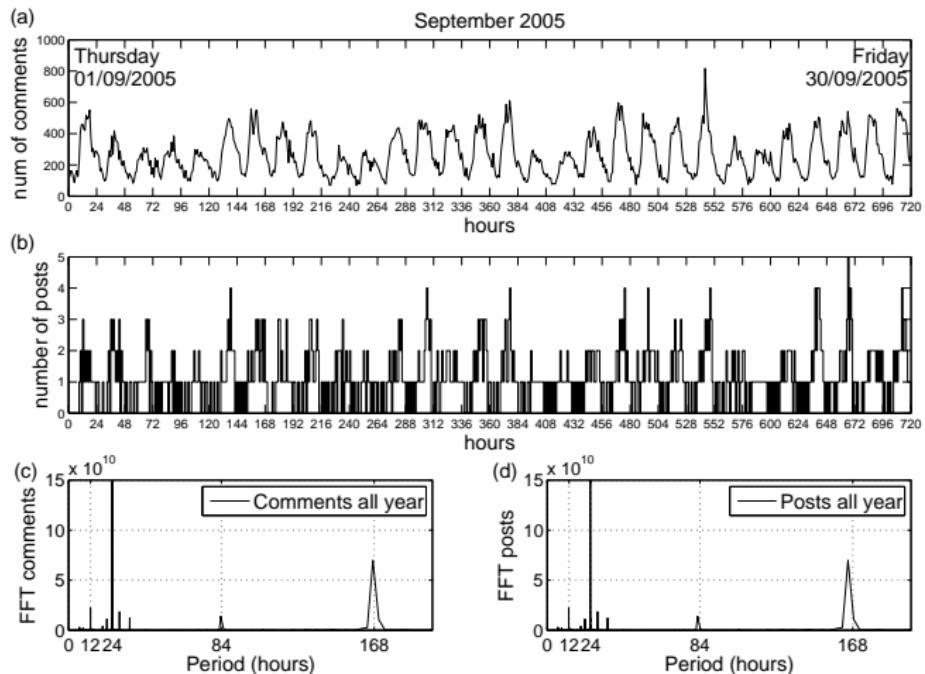

- ▶ Closed form

$$\hat{\mu} = \frac{\sum_i \ln t_i}{n}$$
$$\hat{\sigma}^2 = \frac{\sum_i (\ln t_i - \hat{\mu})^2}{n}$$

- ▶ Alternatively: using `fminsearch` in Matlab or similar tools

Temporal patterns of Slashdot

Time series of total number of comments

- ▶ "Sustained" activity coupled with the circadian rythm.

Temporal patterns of Slashdot

Statistical approach for analyzing reaction times

- ▶ Guess a candidate probability distribution F for reaction times
- ▶ Kolmogorov-Smirnov (KS) test
- ▶ Following hypothesis
 - ▶ H_0 : The reaction time is a sample of distribution F
 - ▶ H_1 : The hypothesis H_0 is not true
- ▶ Compute point-wise maximal difference between the CDF of the data and the approximation (KS statistic)
- ▶ Calculate the p -value: probability of obtaining a result as different as F as the data
- ▶ The greater the p -value, the better the fit
- ▶ For a chosen level of significance α_0 , the hypothesis H_0 is accepted

Temporal patterns of Slashdot

Log-normal model and circadian cycle

- ▶ Incorporating the circadian cycle in the log-normal model

$$f_{\text{LNxC}}(t; \mu, \sigma, C(\cdot)) = \frac{1}{t\sigma\sqrt{2\pi}} \exp\left(\frac{-(\ln(t) - \mu)^2}{2\sigma^2}\right) C(t)$$

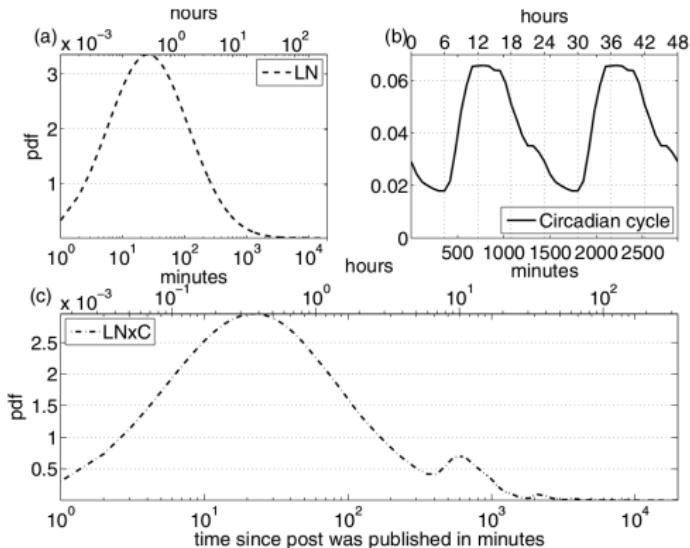

The function $C(\cdot)$ is computed from the data

Temporal patterns of Slashdot

Log-normal model and circadian cycle

- ▶ Incorporating the circadian cycle in the log-normal model

$$f_{\text{LNxC}}(t; \mu, \sigma, C(\cdot)) = \frac{1}{t\sigma\sqrt{2\pi}} \exp\left(\frac{-(\ln(t) - \mu)^2}{2\sigma^2}\right) C(t)$$

Temporal patterns of Slashdot

A mixture of two log-normals

- ▶ A more flexible model
- ▶ Linear combination of two log-normals

$$f_{\text{DLN}}(t; \theta) = kf_{\text{LN}}(t; \mu_1, \sigma_1) + (1 - k)f_{\text{LN}}(t; \mu_2, \sigma_2)$$

- ▶ Parameters $\theta = (k, \mu_1, \sigma_1, \mu_2, \sigma_2)$

A mixture of two log-normals with circadian cycle

- ▶ Incorporating the circadian cycle in the mixture log-normal model

$$f_{\text{DLN}\times\text{C}}(t; \theta) = (kf_{\text{LN}}(t; \mu_1, \sigma_1) + (1 - k)f_{\text{LN}}(t; \mu_2, \sigma_2)) C(t)$$

- ▶ Parameters $\theta = (k, \mu_1, \sigma_1, \mu_2, \sigma_2, C(\cdot))$

Temporal patterns of Slashdot

Summary of models

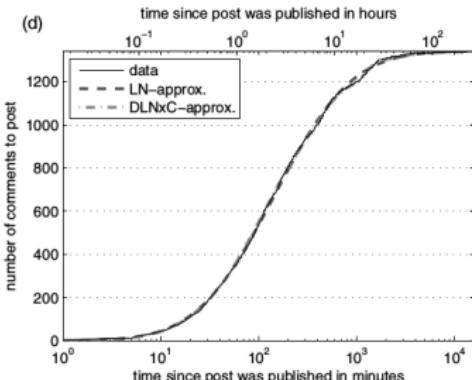

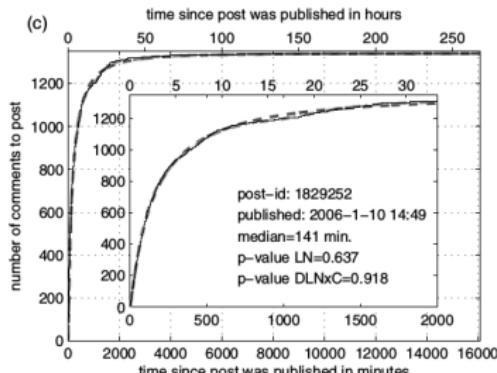

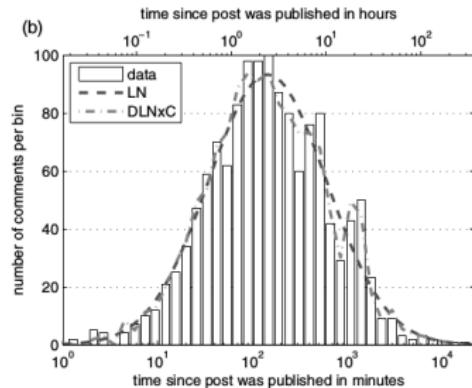

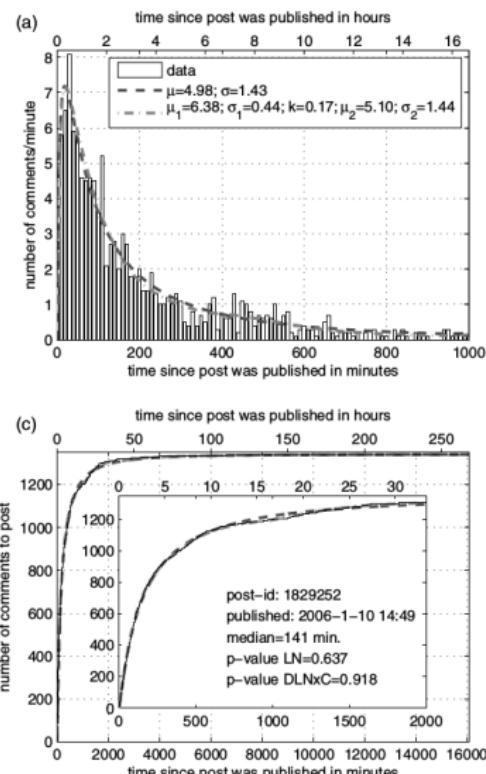

- ▶ (LN) Single log-normal model
- ▶ (LNxC) Single log-normal model with circadian cycle
- ▶ (DLN) Double log-normal model
- ▶ (DLNxC) Double log-normal model with circadian cycle

Tasks

- ▶ Model comparison
- ▶ Which model is better? How much? Why?
- ▶ Can we interpret the parameters?

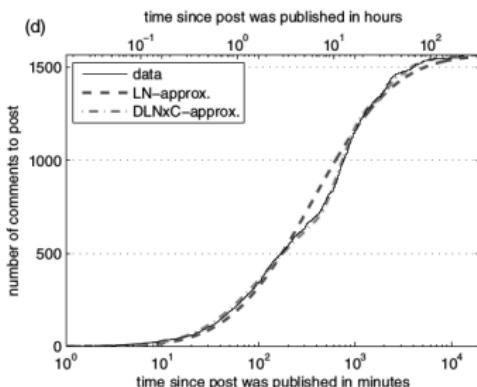

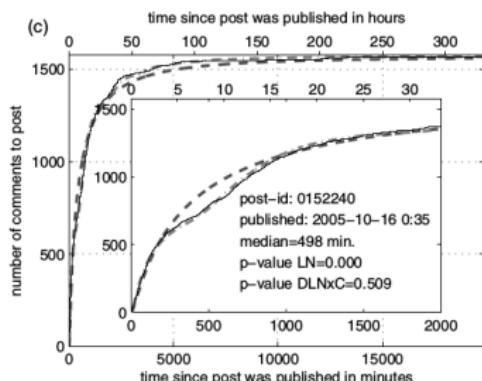

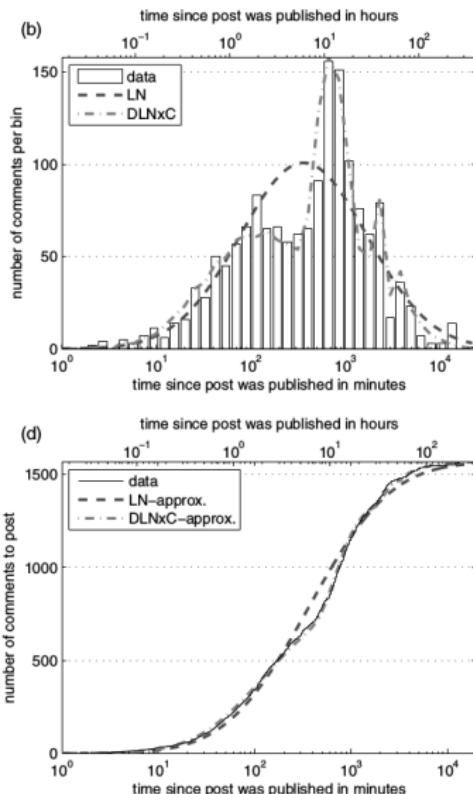

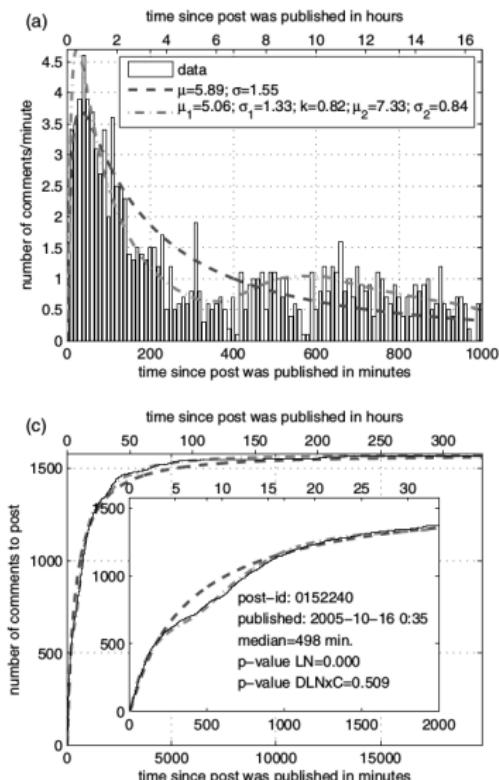

Temporal patterns of Slashdot

Single-post analysis (post published in the afternoon)

Temporal patterns of Slashdot

Single-post analysis (post published during night)

Temporal patterns of Slashdot

Some conclusions

- ▶ All posts show a stereotyped behavior
- ▶ Accurate fitting using models based on log-normal distributions
- ▶ LN model performs well for post published in daylight
- ▶ DLNxC model outperforms LN for post published during night

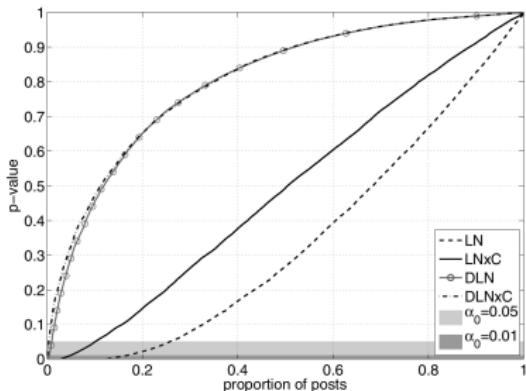

Temporal patterns of Slashdot

Approximating all posts

- ▶ Analysis of distribution of KS statistic and p-values

α_0	0.01	0.05
LN	16.68%	25.62%
LNxC	4.80%	9.88%
DLN	0.44%	0.96%
DLNxC	0.11%	0.33%

Table 1. Percentage of rejected 0-Hypotheses

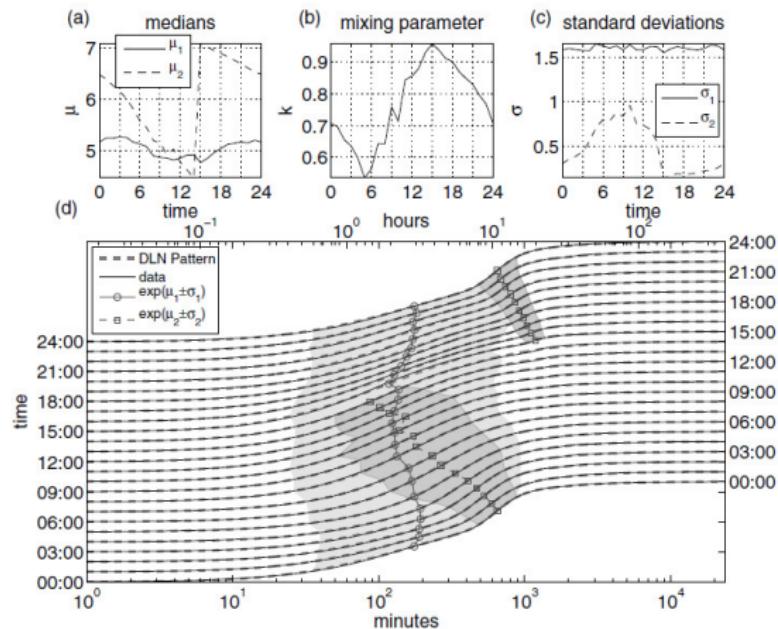

- ▶ LN model explains 83% of the posts
- ▶ Incorporating cycle in LN improves significantly
- ▶ DLNxC and DLN account for more than 99% of the data
- ▶ DLN accounts for the main part of variation caused by the circadian rhythm

Temporal patterns of Slashdot

Qualitative explanation: Two waves of activity

- ▶ First wave: locked to the post publication
- ▶ Second wave: depends on the publication hour
- ▶ Only the first wave is necessary in a short interval.

Temporal patterns of Slashdot

Popularity prediction

- ▶ At time t we want to **predict the number of comments** in the next s minutes of a post published x minutes ago and has received until now N comments
- ▶ Use available data window $[t - x, t]$ and predict the number of comments M in the prediction window $(t, t + s]$.

Challenges

- ▶ Large variability between posts
- ▶ Transient behaviour (sharp initial raise)
- ▶ Heavy tails: difficult to simply extrapolate based on evidence
- ▶ Limited information (no content)

Temporal patterns of Slashdot

Popularity prediction

- ▶ At time t we want to **predict the number of comments** in the next s minutes of a post published x minutes ago and has received until now N comments
- ▶ Use available data window $[t - x, t]$ and predict the number of comments M in the prediction window $(t, t + s]$.

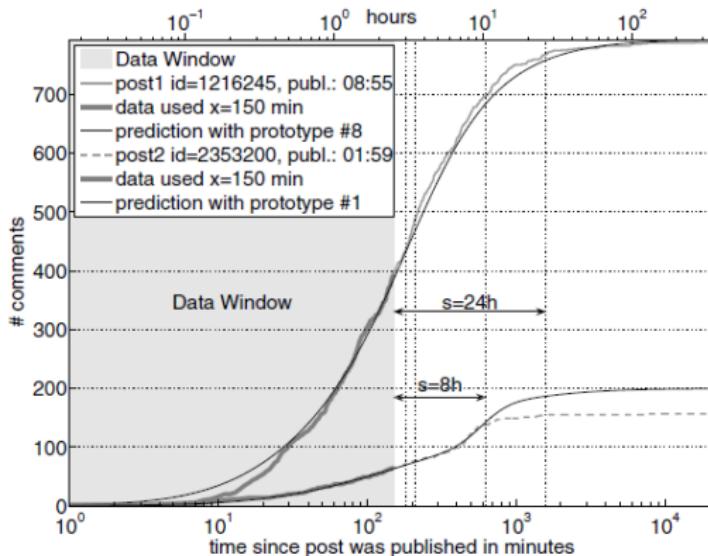

Methodology

- ▶ Compute DLN prototypes, one for every hour of the day
- ▶ Prediction is made by rescaling the corresponding prototype given the limited data window
- ▶ Use older posts (first months of data) as *training set*
- ▶ Error measure (relative):

$$\epsilon = |(M_{\text{predicted}} - M_{\text{real}})/M_{\text{real}}|$$

Temporal patterns of Slashdot

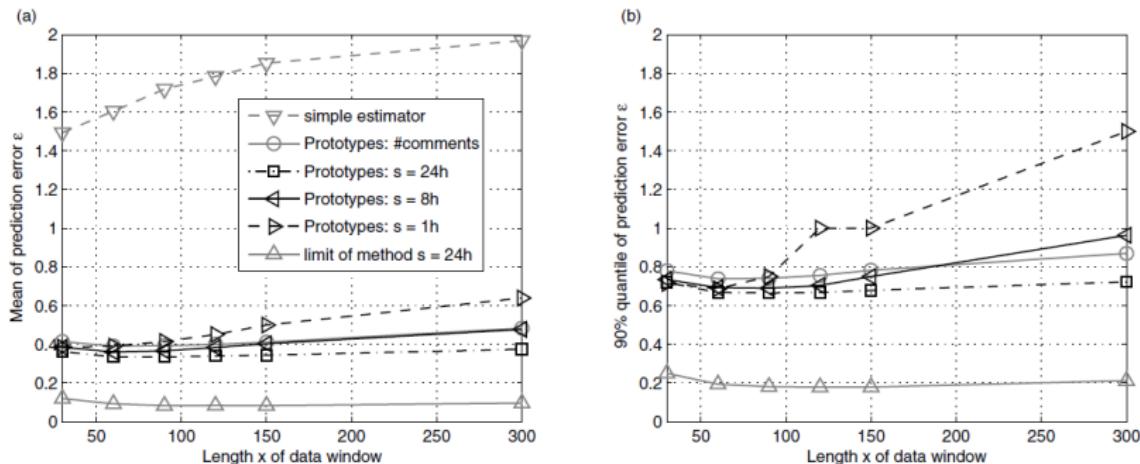

Popularity prediction: two illustrative examples

- ▶ Prediction of post1 is satisfactory at all times
- ▶ Prediction of post2 is satisfactory until 8 hours and overestimated afterward

Temporal patterns of Slashdot

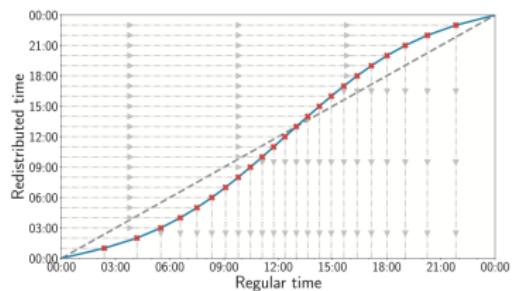

Popularity prediction: results

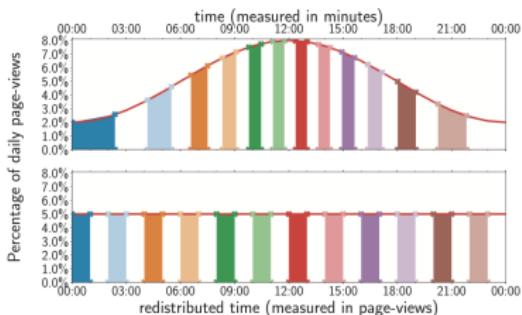

- ▶ Best results are obtained for a 24 hour prediction
- ▶ Num. comments more relevant than data window length
- ▶ Error increases in the tail: large number of posts with a very low number of comments in the prediction window

Alternative way to deal with Activity Cycles

Rescale Time

(b) Mapping time in minutes (t) to time in page-views (t^*). The gray arrows indicate the direction of the mapping.

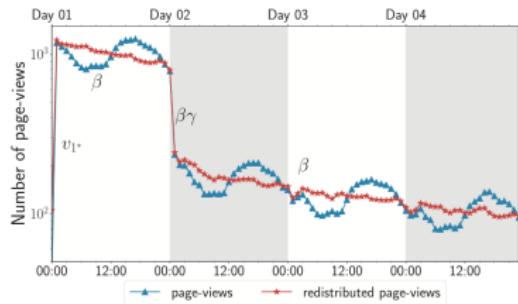

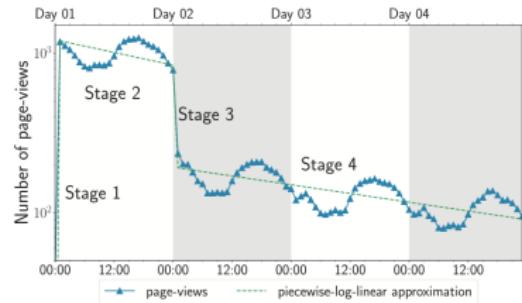

(c) Visualization of the effects of time redistribution.

- ▶ Image from (ten Thij et al., 2019)
- ▶ measure time in activity not in minutes

Alternative way to deal with Activity Cycles

Rescale Time

- ▶ Image from [ten Thij et al., 2019]
- ▶ Show regular decay of interest in new Items on Wikipedia's Featured Articles

Temporal patterns of Slashdot

Conclusions

- ▶ A parsimonious approach that disregards content is valid
- ▶ DLN distributions provide an excellent explanation for the reaction times
- ▶ Parameters have a nice interpretation: two waves of activity, each corresponding to a LN
- ▶ In some cases, this approach allows for reliable prediction based on limited amounts of data

Title: *"Can Ordinary PC Users Ditch Windows for Linux?"*

- ▶ Online conversations as networks: **nodes** correspond to comments, **edges** represent a reply action

Modeling conversation threads

Datasets:

Slashdot (SL) : Technological news aggregator.

473,065 conversations, $2 \cdot 10^6$ comments, $93 \cdot 10^3$ users

Barrapunto (BP) : Spanish version of Slashdot.

44,208 conversations, $4 \cdot 10^5$ comments, $50 \cdot 10^3$ users

Meneame (MN) : Spanish Digg clone (general news aggregator)

58,613 conversations, $2.1 \cdot 10^6$ comments, $5,4 \cdot 10^4$ users

Wikipedia (WK) : conversation pages related to every article.

871,485 conversations, $\approx 10^7$ comments, $3.5 \cdot 10^5$ users

Modeling conversation threads

General approach

- ▶ Suggest features based on prior empirical analysis
- ▶ Propose a generative model
- ▶ Learn the model parameters based on data
- ▶ Interpret, understand, predict the real system based on the learned parameters

Bottom-up

- ▶ Simple models are preferable (only a few features are relevant)
- ▶ First approach
 - ▶ Discard content, discard user network
 - ▶ Assume threads size is known

Modeling conversation threads

General approach:

- ▶ The threads growth model must reproduce
 - ▶ Their statistical structure
 - ▶ Their evolution
- ▶ No content involved
- ▶ No authorship
- ▶ Essentially "*Which comment is going to be replied next?*"

Empirical facts

- ▶ Popular comments receive more replies: *preferential attachment*
- ▶ New comments are more *attractive* than old ones
- ▶ Replies to the post behave different than replies to comments

Modeling conversation threads

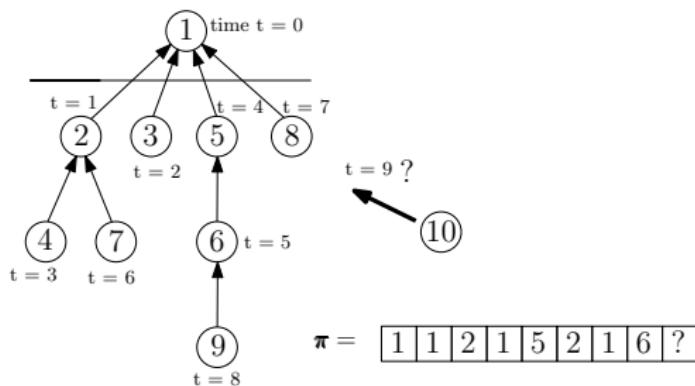

Representation of a conversation

- ▶ vector of parent nodes π , where π_t denotes the parent of the node with id $t + 1$ added at time-step t

$$\pi_0 = ()$$

$$\pi_1 = (1)$$

⋮

Modeling conversation threads

Parameters of the model: popularity

- ▶ At time t , the **popularity** of node k is its degree

$$d_{k,t}(\pi_{(1:t-1)}) = \begin{cases} 1 + \sum_{m=2}^{t-1} \delta_{k\pi_m} & \text{for } k \in \{1, \dots, t\} \\ 0 & \text{otherwise,} \end{cases}$$

- ▶ $d_{k,t}$ is weighted by α

Modeling conversation threads

Parameters of the model: novelty

- ▶ At time t , the **novelty** of node k is

$$n_{k,t} = \tau^{t-k+1}, \quad \tau \in [0, 1]$$

- ▶ Captures an exponential decay of novelty

Modeling conversation threads

Parameters of the model: root bias

- ▶ The bias of a node k is either zero or β for the root:

$$b_k = \beta, \quad \text{for } k = 1, \text{ and } 0 \text{ otherwise}$$

- ▶ Captures the different law governing post replies and replies to comments

Modeling conversation threads

Model definition

- ▶ We define a model by means of its associated *attractiveness* function $\phi(\cdot)$, which is defined for each of the nodes.
- ▶ At time $t + 1$, a new node is linked to node k with probability:

$$p(\pi_t = k | \pi_{(1:t-1)}) = \frac{\phi(k)}{Z_t}, \quad Z_t = \sum_{l=1}^t \phi(l),$$

Different model variants

- ▶ Full model (**FM**)

$$\phi(k) = \alpha d_{k,t} + b_k + \tau^{t-k+1}$$

- ▶ Parameters $\{\alpha, \tau, \beta\}$

Modeling conversation threads

Model definition

- ▶ We define a model by means of its associated *attractiveness* function $\phi(\cdot)$, which is defined for each of the nodes.
- ▶ At time $t + 1$, a new node is linked to node k with probability:

$$p(\pi_t = k | \pi_{(1:t-1)}) = \frac{\phi(k)}{Z_t}, \quad Z_t = \sum_{l=1}^t \phi(l),$$

Different model variants

- ▶ Model without popularity model (**NO- α**)

$$\phi(k) = b_k + \tau^{t-k+1}$$

- ▶ Parameters $\{\tau, \beta\}$, $\alpha = 0$

Modeling conversation threads

Model definition

- ▶ We define a model by means of its associated *attractiveness* function $\phi(\cdot)$, which is defined for each of the nodes.
- ▶ At time $t + 1$, a new node is linked to node k with probability:

$$p(\pi_t = k | \pi_{(1:t-1)}) = \frac{\phi(k)}{Z_t}, \quad Z_t = \sum_{l=1}^t \phi(l),$$

Different model variants

- ▶ Model without novelty (**NO- τ**)

$$\phi(k) = \alpha d_{k,t} + b_k + 1$$

- ▶ Parameters $\{\alpha, \beta\}$, $\tau = 1$

Modeling conversation threads

Model definition

- ▶ We define a model by means of its associated *attractiveness* function $\phi(\cdot)$, which is defined for each of the nodes.
- ▶ At time $t + 1$, a new node is linked to node k with probability:

$$p(\pi_t = k | \pi_{(1:t-1)}) = \frac{\phi(k)}{Z_t}, \quad Z_t = \sum_{l=1}^t \phi(l),$$

Different model variants

- ▶ Model without bias (**NO-bias**)

$$\phi(k) = \alpha d_{k,t} + \tau^{t-k+1}$$

- ▶ Parameters $\{\alpha, \tau\}$, $\beta = 0$

Modeling conversation threads

Parameter estimation

- ▶ Maximum likelihood
- ▶ Given a set $\Pi := \{\pi_1, \dots, \pi_N\}$ of N trees with respective sizes $|\pi_i|$, $i \in \{1, \dots, N\}$, the likelihood for θ can be written as

$$\begin{aligned}\mathcal{L}(\Pi|\theta) &= \prod_{i=1}^N p(\pi_i|\theta) \\ &= \prod_{i=1}^N \prod_{t=2}^{|\pi_i|} p(\pi_{t,i}|\pi_{(1:t-1),i}, \theta) \\ &= \prod_{i=1}^N \prod_{t=2}^{|\pi_i|} \frac{\phi(\pi_{t,i})}{Z_{t,i}}\end{aligned}$$

Modeling conversation threads

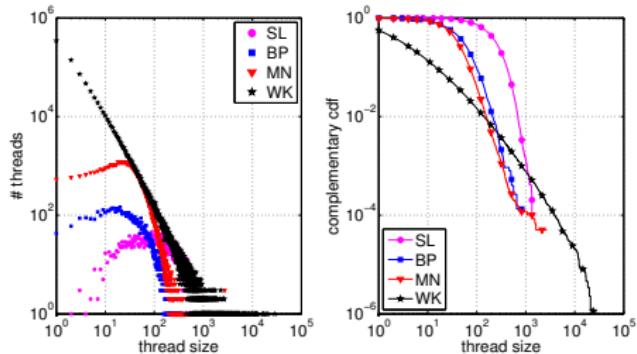

Parameter estimation

- ▶ Minimization problem

$$-\log \mathcal{L}(\Pi|\theta) = -\sum_{i=1}^N \sum_{t=2}^{|\pi_i|} \log \phi(\pi_{t,i}) + \log Z_{t,i}$$

Modeling conversation threads

Global analysis of the data

- ▶ SL, BP and MN present a distribution with a defined scale.
- ▶ Discussion sizes in Wikipedia *seem to be* scale-free.

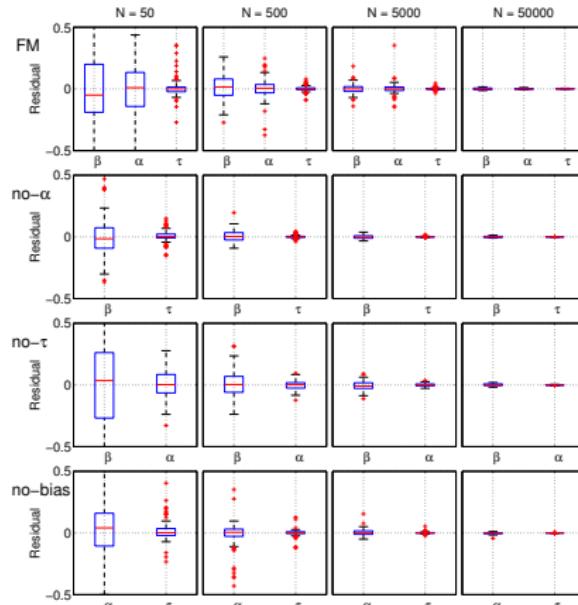

Parameter estimation

Validation

- ▶ Choose θ^* randomly
- ▶ Generate N threads
- ▶ Find estimates $\hat{\theta}$
- ▶ Compute residuals $\theta^* - \hat{\theta}$
- ▶ Repeat for 100 times.

Modeling conversation threads

Validation

- ▶ Estimation is unbiased
- ▶ Good estimates can be obtained using $N = 50$

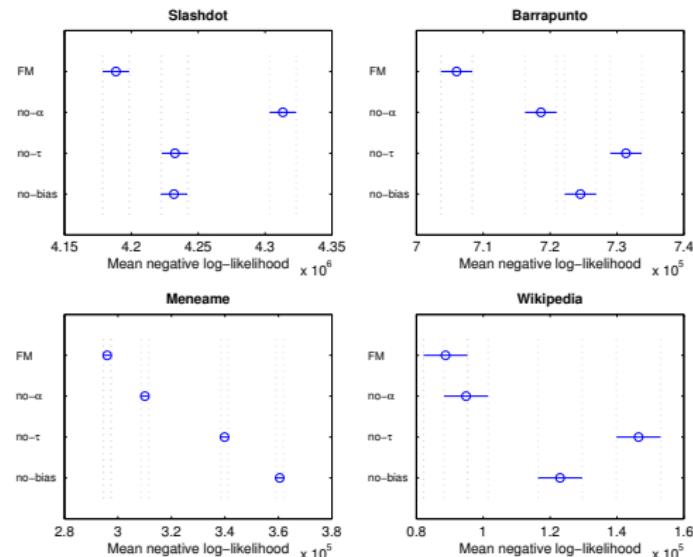

Modeling conversation threads

Model Comparison

For each dataset:

- ▶ Select N threads randomly with replacement
- ▶ Find estimates $\hat{\theta}$.
- ▶ Compute likelihoods

- ▶ Model comparison based on likelihoods for each dataset

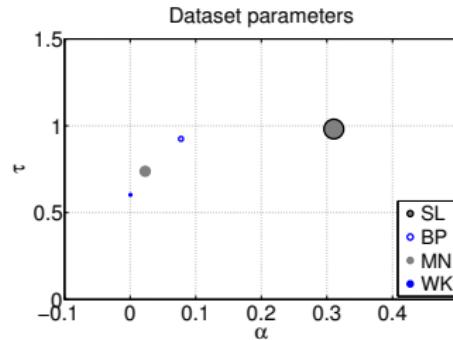

Modeling conversation threads

Parameter estimates for the different datasets

Dataset	$\log \beta$	α	τ
$N = 50$			
SL	2.39 (0.17)	0.31 (0.02)	0.98 (0.02)
BP	0.93 (0.12)	0.08 (0.04)	0.92 (0.00)
MN	1.66 (0.16)	0.03 (0.01)	0.72 (0.04)
WK	-0.21 (0.81)	0.00 (0.00)	0.40 (0.19)
$N = 5000$			
SL	2.39 (0.01)	0.31 (0.01)	0.98 (0.00)
BP	0.96 (0.02)	0.08 (0.00)	0.92 (0.00)
MN	1.69 (0.03)	0.02 (0.00)	0.74 (0.01)
WK	0.39 (0.22)	0.00 (0.00)	0.60 (0.01)

- ▶ Bootstrap with $N = 50$ threads already gives good estimates

Modeling conversation threads

Validation of the model

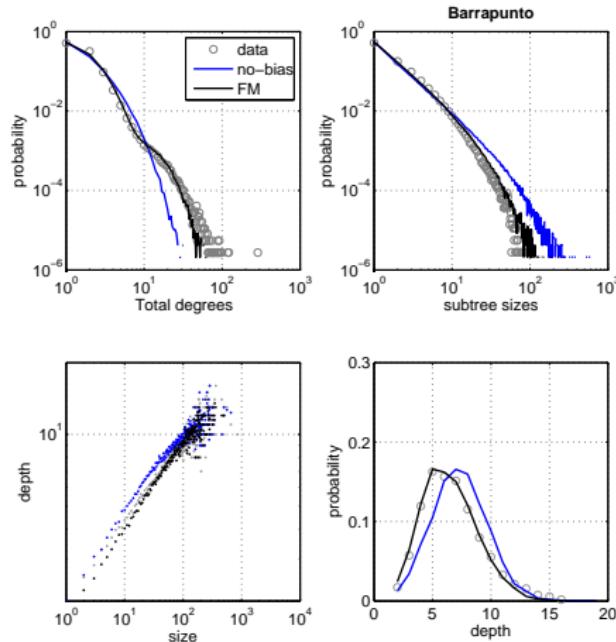

- ▶ Original data versus synthetic threads produced by the model
 - ▶ Degrees distribution
 - ▶ Subtree sizes distribution
 - ▶ Mean node depth versus size
 - ▶ Node depths distribution

Generating threads

- ▶ Threads sizes are drawn from the empirical distribution
- ▶ We use model **NO-BIAS** for comparison

Growing tree model for conversation threads

Comparison between real and synthetic threads

Real threads:

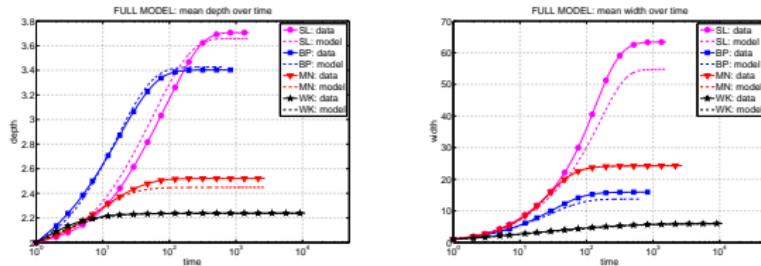

Synthetic threads:

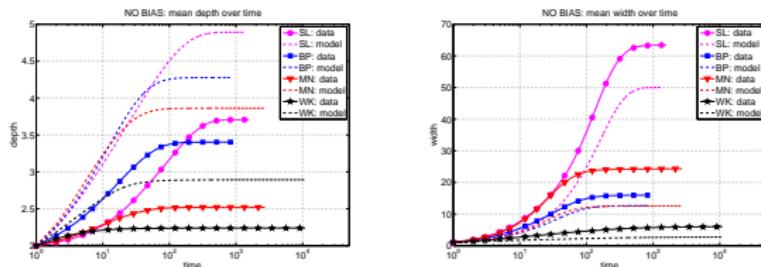

Evolution of mean depths and mean widths

FULL MODEL:

NO-BIAS model:

Modeling conversation threads

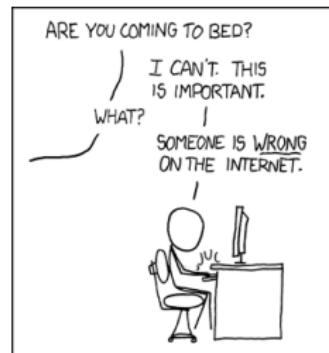

Adding authorship

Extending the model

- ▶ Main interest: understanding user behavior
- ▶ Is the author relevant to determine the structure of the discussion?
- ▶ Can we extend minimally the model to incorporate authorship?

Design choices

- ▶ User → Discussion?
- ▶ Discussion → User?
- ▶ Empirical observation: Reciprocity
 - ▶ User A tends to reply user B who previously replied to A

Modeling conversation threads

Adding authorship

Extending the model

- ▶ Two coupled processes
- ▶ Growing authorship vector $a_{1:t} = (a_1, a_2, \dots, a_t)$
- ▶ In addition to $\pi_{1:t} = (\pi_1, \pi_2, \dots, \pi_t)$
- ▶ At time $t + 1$
 - ▶ A new author is created with p_{new}
 - ▶ An existing author v is chosen, otherwise
- ▶ If existing author v , chosen according to the number of replies to v in the thread, r_v

$$p(a_{t+1} = v | a_{1:t}, \pi_{1:t}) = \begin{cases} p_{new}, & \text{for } v = U + 1 \\ \frac{(1-p_{new})2^{r_v}}{\sum_{i=1}^U 2^{r_i}}, & \text{for } v \in 1, \dots, U \end{cases}$$

Modeling conversation threads

Adding authorship

Extending the model

- ▶ New reciprocity parameter κ , $\theta' = (\alpha, \tau, \beta, \kappa)$
- ▶ Extended attractiveness function $\phi'_j(\cdot)$

$$\phi'_j(\pi_{1:t}, a_{1:t}; \theta') := \phi_j(\pi_{1:t}; \theta) + \kappa \delta_{a_{\pi_j}, a_{t+1}}$$

- ▶ Leads to the extended full model

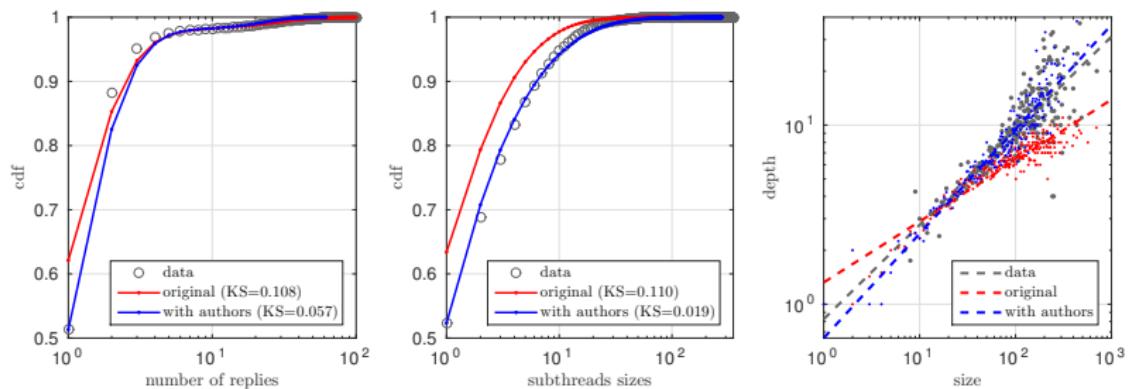

$$p'(\pi_{t+1} = j | \pi_{1:t}, a_{1:t}; \theta') \propto \phi'_j(\pi_{1:t}, a_{1:t}; \theta')$$

- ▶ Only when $a_{\pi_j} = a_{t+1}$, κ -term
 - $\kappa = 0$: the new feature will play no role
 - $\kappa \gg 0$: all comments reciprocal
- ▶ Optimization of θ' using maximum likelihood

Modeling conversation threads

Adding authorship

Model comparison (degrees, subthread sizes, depth vs size)

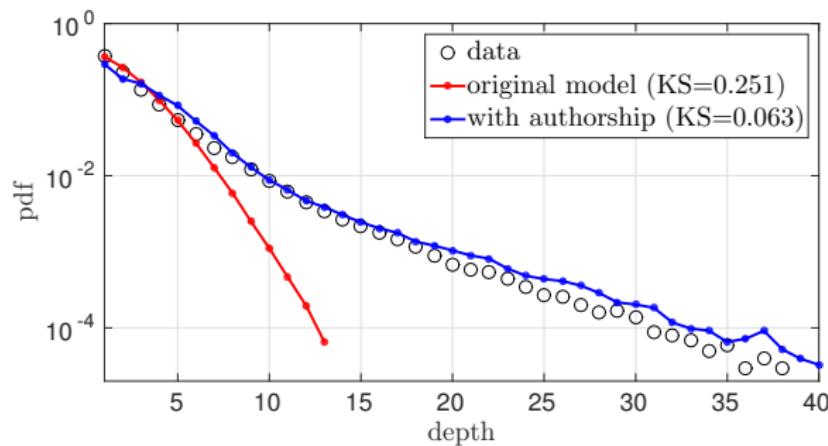

- Features are reproduced better thanks to the authorship model and the reciprocity feature

Modeling conversation threads

Adding authorship

Model comparison (thread depths)

- ▶ original model is FULL model
- ▶ Extended model reproduces the long tail created by reciprocal message chains accurately

Conclusions and current directions

Conclusions

- ▶ Framework which allows to re-create conversations with similar structural features as real instances
- ▶ Model captures the large heterogeneity of the data
- ▶ Parameters allow to characterize audience and platform:
 - ▶ Same platform : differences between SL and BP
 - ▶ Influence of the interface: MN (flat) characterized by bias
 - ▶ Main difference between news media and WK: popularity
- ▶ A minimal increase in complexity (authorship and reciprocity) greatly improves the overall descriptive power of the model

Application : Evaluation of platform design

- Can be used to assess the impact of a given design element on the user interaction patterns on a platform.
- Shows the interdependency between user interaction patterns and platform design elements.
- Can be exploited to help site owners and community managers to create a positive and constructive environment for large scale online discussions.

Application: Evaluation of platform design

Example: Change of how conversation threads are presented

- Aragón et al. [2017] analyze the impact of threaded vs. non-threaded conversation views

This screenshot shows a threaded conversation on a news article. The main post discusses the launch of a digital participation portal. Below it, a user asks if the portal links to a legislative platform. A third user responds that it does, and another user asks for more details. The conversation continues with users discussing the portal's features and its connection to the legislative platform.

Barcelona estrena portal y proceso de participación digital-presencial con software libre

#1 Si, no sé, es que enlazar el portal y enlazar a una noticia son cosas bastante diferentes. Pero bueno, puedo tumbar esta noticia si se considera dudo. Yo tengo mis dudas. En la noticia se aporta contexto y se explica, la relacionada te lleva directamente al portal. IMHO.

#2 Lo dejo en la duda y para mí lo importante es que la gente se entere para que participe

#3 Y gracias a Barcelona en Comú. Recorremos que Ada se hizo famosa en España porque era la portavoz de toda la PAH. En Barcelona en Comú también pasa lo mismo. Ahora ya no es portavoz, si no alcaldesa con un fenomenal equipo. Así que gracias Barcelona en Comú y a tí también Ada.

Impact of Conversation Threading
on Online Discussion,
ICWSM-17, Montreal, Canada.

This screenshot shows a non-threaded conversation view of the same news article. The main post is identical. However, the replies are presented as separate, non-linked comments. The first reply is from a user asking for more details, and the second is from a user responding that the portal links to the legislative platform. The third comment is a reply to the second, continuing the discussion.
